

SAA-8

Amazon CloudWatch Metrics

- CloudWatch provides metrics for every services in AWS
- **Metric** is a variable to monitor (CPUUtilization, NetworkIn...)
- Metrics belong to **namespaces**
- **Dimension** is an attribute of a metric (instance id, environment, ect ...)
- Up to 10 dimensions per metric
- Metrics have **timestamps**
- Can create CloudWatch dashboards of metrics
- Can create **CloudWatch Custom Metrics** (for the RAM for example)

CloudWatch Metric Streams

- Continually stream CloudWatch metrics to a destination of your choice, with **near-real-time** delivery and low latency
 - Amazon Kinesis Data Firehose (and then its destinations)
 - 3rd party service provider: Datadog, Dynatrace, New Relic, Splunk, Sumo Logic ...
- Option to **filter metrics** to only stream a subset of them

CloudWatch Logs

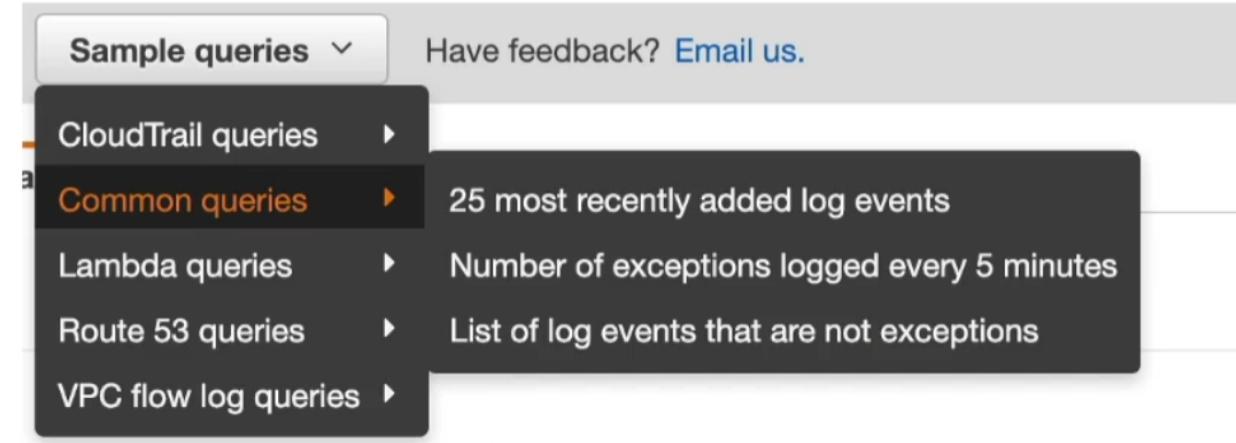

- **Log groups:** arbitrary name, usually representing an application
- **Log stream:** instances within application / log files / containers
- Can define log expiration policies (never expire, 30 days, etc ...)
- **CloudWatch Logs can send logs to:**
 - Amazon S3 (exports)
 - Kinesis Data Streams
 - Kinesis Data Firehose
 - AWS Lambda
 - ElasticSearch

CloudWatch Logs - Sources

- SDK, CloudWatch Logs Agent, CloudWatch Unified Agent
- Elastic Beanstalk: collection of logs from application
- ECS: collection from containers
- AWS Lambda: collection from function logs
- VPC Flow Logs: VPC specific logs
- API Gateway
- CloudTrail based on filter
- Route53: Log DNS queries

CloudWatch Logs Metric Filter & Insights

- CloudWatch Logs can use filter expressions
 - For example, find a specific IP inside of a log
 - Or count occurrences of "ERROR" in your logs
- Metric filters can be used to trigger CloudWatch alarms
- CloudWatch Logs Insights can be used to query logs and add queries to CloudWatch Dashboards

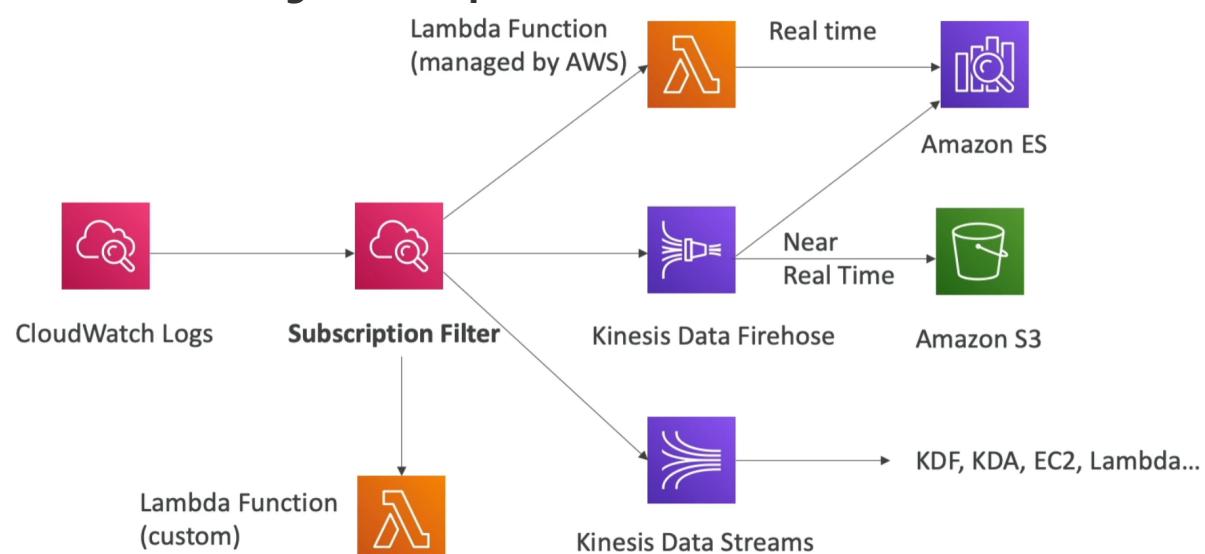

CloudWatch Logs - S3 Export

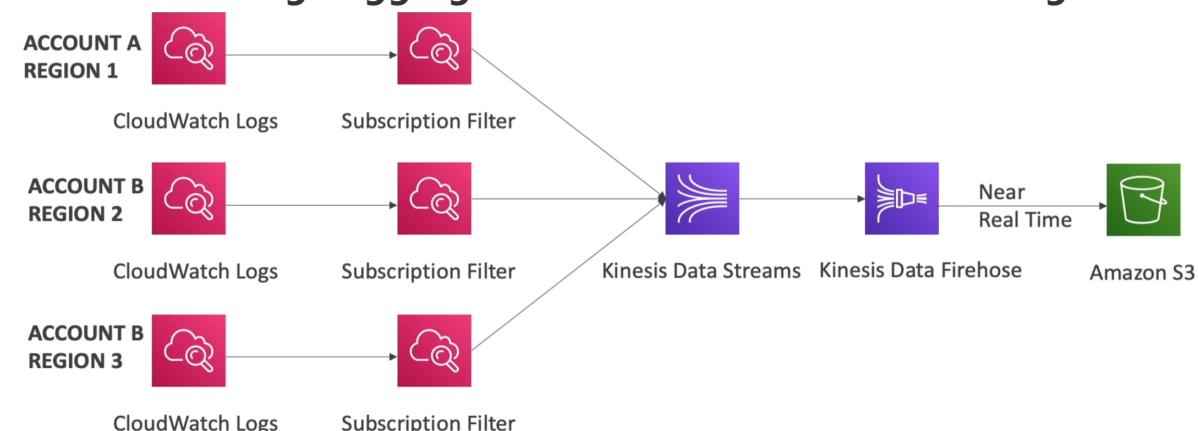

- Log data can take **up to 12 hours** to become available for export
- The API call is **CreateExportTask**
- Not near-real time or real-time... use Logs Subscriptions instead

CloudWatch Logs Subscriptions

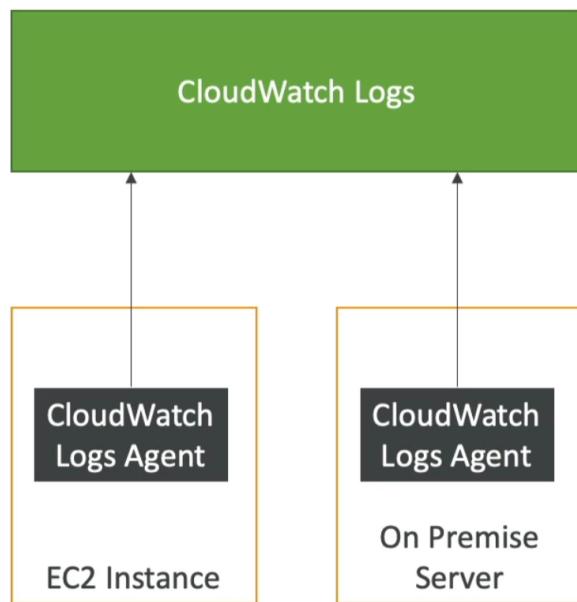

CloudWatch Logs Aggregation Multi-Account & Multi Region

CloudWatch Logs for EC2

- By default, no logs from your EC2 machine will go to CloudWatch
- You need to run a CloudWatch agent on EC2 to push the log files you want
- Make sure IAM permissions are correct
- The CloudWatch log agent can be setup on-premises too

CloudWatch Logs Agent & Unified Agent

- For virtual servers (EC2 instances, on-premise servers ...)
- **CloudWatch Logs Agent**
 - Old version of the agent
 - Can only send to CloudWatch Logs
- **CloudWatch Unified Agent**
 - Collect additional system-level metrics such as RAM, processes, etc ...
 - Collect logs to send to CloudWatch Logs
 - Centralized configuration using SSM Parameter Store

CloudWatch Unified Agent - Metrics

- Collected directly on your Linux server / EC2 instance
- **CPU** (active, guest, idle, system, user, steal)
- **Disk metrics** (free, used, total), Disk IO (writes, reads, bytes, iops)
- **RAM** (free, inactive, used, total, cached)
- **Netstat** (number of TCP and UDP connections, net packets, bytes)
- **Processes** (total, dead, blocked, idle, running, sleep)
- **Swap Space** (free, used, used %)
- Reminder: out-of-the box metrics for EC2 - disk, CPU, network (high level)

CloudWatch Alarms

- Alarms are used to trigger notifications for any metric
- Various options (sampling, %, max, min, ect ...)
- Alarm States:
 - OK
 - INSUFFICIENT_DATA
 - ALARM
- Period
 - Length of time in seconds to evaluate the metric
 - High resolution custom metrics: 10 sec, 30 sec or multiples of 60 sec

CloudWatch Alarm Targets

- Stop, Terminate, Reboot, or Recover an EC2 Instance
- Trigger Auto Scaling Action
- Send notification to SNS (from which you can do pretty much anything)

Amazon EC2

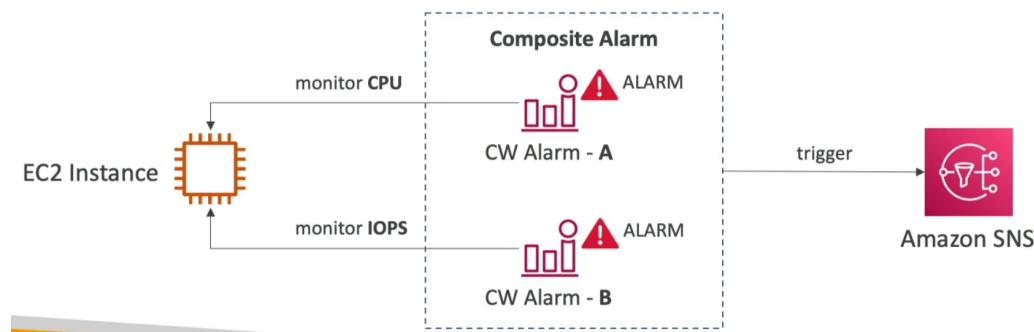

EC2 Auto Scaling

Amazon SNS

CloudWatch Alarms - Composite Alarms

- CloudWatch Alarms are on a single metric
- **Composite Alarms are monitoring the states of multiple other alarms**
- AND and OR conditions
- Helpful to reduce "alarm noise" by creating complex composite alarms

EC2 Instance Recovery

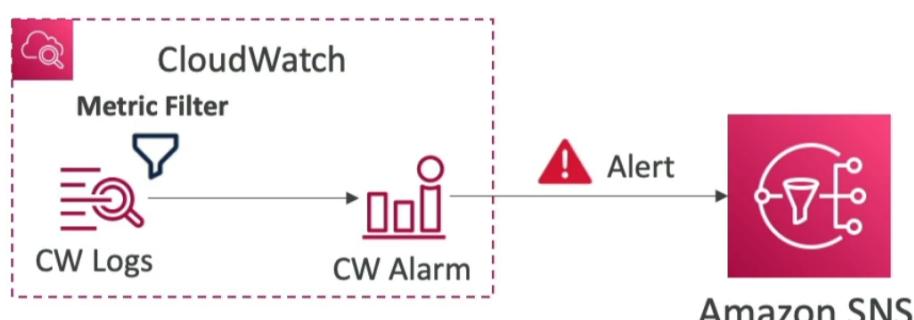

- Status Check:
 - Instance status = check the EC2 VM
 - System status = check the underlying hardware

- **Recovery:** Same Private/Public, Elastic IP, metadata, placement group

CloudWatch Alarm: good to know

- Alarms can be created based on CloudWatch Logs Metrics Filters

- To test alarms and notifications, set the alarm state to Alarm using CLI `aws cloudwatch set-alarm-state --alarm-name "myalarm" --state-value ALARM --state-reason "testing purposes"`

Hands On

A screenshot of the AWS CloudWatch Alarms console. The left sidebar shows navigation options like 'CloudWatch', 'Dashboards', 'Alarms', 'Logs', and 'Metrics'. The main pane displays a table titled 'Alarms (0)' with columns for 'Name', 'State', 'Last state update', and 'Conditions'. A message at the bottom states 'No alarms to display'. There is a 'Create alarm' button at the top right of the table area.

CloudWatch > Alarms > Create alarm

Step 1 Specify metric and conditions

Step 2 Configure actions

Step 3 Add name and description

Amazon EventBridge (formerly CloudWatch Events)

- Schedule: Cron jobs (scheduled scripts)

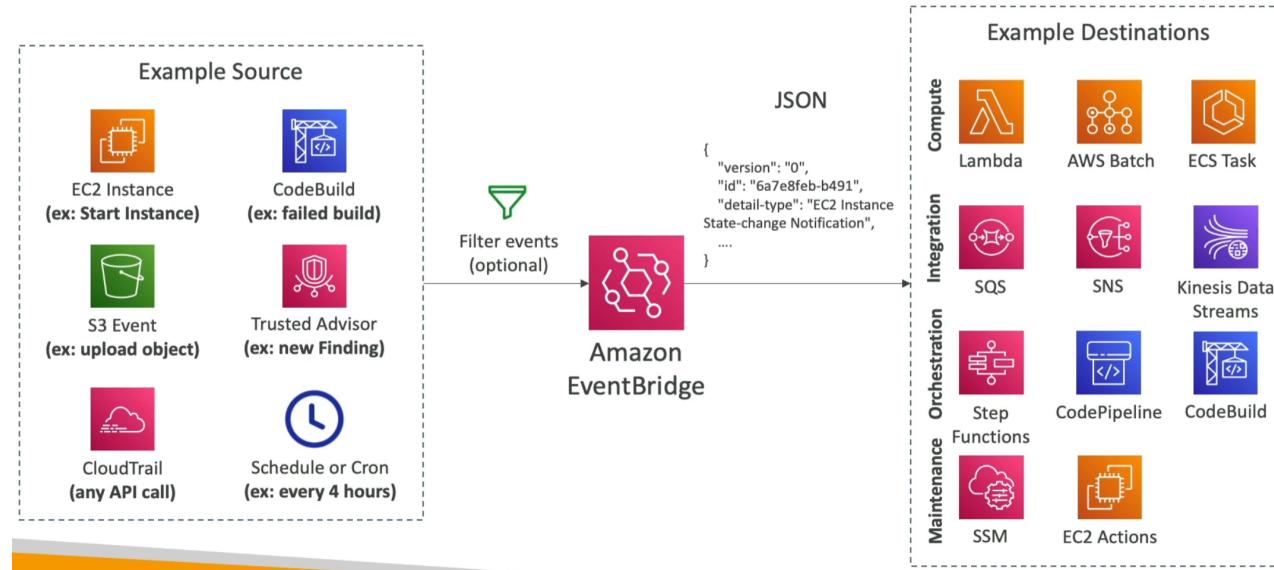

- Event Pattern: Event rules to react to a service doing something

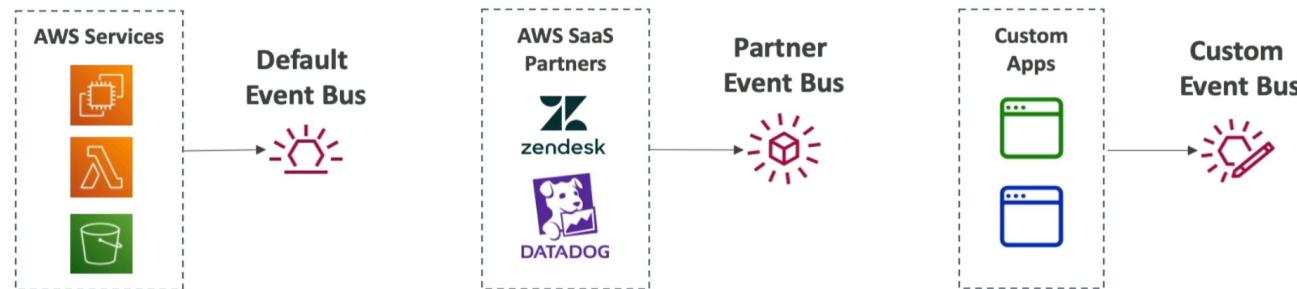

- Trigger Lambda functions, send SQS/SNS messages...

Amazon EventBridge Rules

Amazon EventBridge

- Event buses can be accessed by other AWS accounts using Resource-based Policies
- You can **archive events** (all/filter) sent to an event bus (indefinitely or set period)
- Ability to **replay archived events**

Amazon EventBridge - Schema Registry

- EventBridge can analyze the events in your bus and infer the **schema**
- The **Schema Registry** allows you to generate code for your application, that will know in advance how data is structured in the event bus
- Schema can be versioned

The screenshot shows the AWS Schema Registry interface for the event type `aws.codepipeline@CodePipelineActionExecutionStateChange`. The **Schema details** section displays the following information:

Schema name	Last modified	Schema ARN
<code>aws.codepipeline@CodePipelineActionExecutionStateChange</code>	Dec 1, 2019, 12:11 AM GMT	-
Description		aws.events
Schema for event type		Number of versions
<code>CodePipelineActionExecutionStateChange</code> , published by AWS service <code>aws.codepipeline</code>		1
		Schema type
		OpenAPI 3.0

The **Version 1** section shows the OpenAPI 3.0 schema:

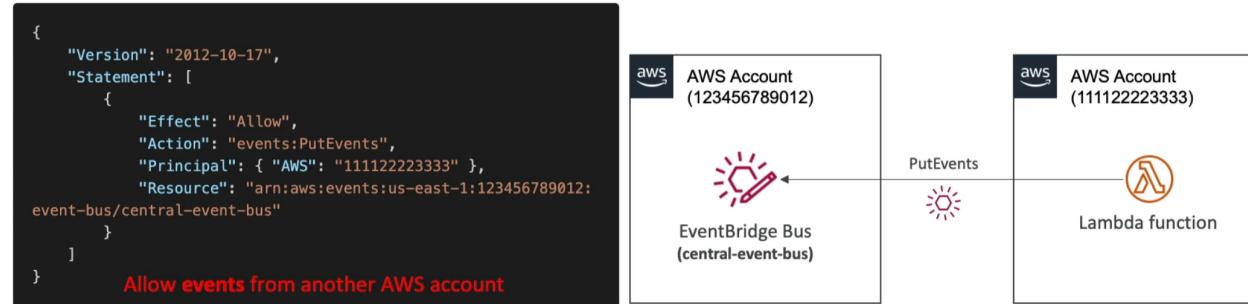

```

1 {
2   "openapi": "3.0.0",
3   "info": {
4     "version": "1.0.0",
5     "title": "CodePipelineActionExecutionStateChange"
6   },
7   "paths": {},
8   "components": {
9     "schemas": {
10       "AWSEvent": {
11         ...
12       }
13     }
14   }
15 }
  
```

Amazon EventBridge - Resource-based Policy

- Manage permissions for a specific Event Bus
- Example: allow/deny events from another AWS account or AWS region

- Use case: aggregate all events from your AWS Organization in a single AWS account or AWS region

Hands on

The screenshot shows the CloudWatch Events console with the following interface elements:

- CloudWatch** sidebar with navigation links: Favorites, Dashboards, Alarms, Logs, Metrics, X-Ray traces, Events (selected), Rules, Event Buses, Application monitoring, Insights, Settings, Getting Started.
- CloudWatch Events is now EventBridge** header.
- Additional capabilities in Amazon EventBridge** section:
 - Integrated SaaS partner event sources**: Describes receiving events from SaaS partners like Zendesk, MongoDB, and PagerDuty.
 - Custom and partner event buses**: Describes default, custom, and partner event buses.
 - Schema registries**: Describes automatically discovering schemas of events on event buses.
 - Archive and replay events**: Describes replaying archived events.
- Buttons**: Go to Amazon EventBridge, Go to EventBridge documentation, Back to CloudWatch Events.

The screenshot shows the **Event bus detail** configuration page for an event bus named **central-event-bus-v2**:

- Name**: central-event-bus-v2
- Event archive Info**: Enabled
- Archive name**: central-event-bus-v2-archive
- Description - optional**: Event description
- Schema discovery Info**: Enabled

Event Sources can come from partners

The screenshot shows the **Amazon EventBridge partners** page, listing partners and their integration capabilities:

- Amazon EventBridge partners (43)**:
 - salesforce**: Stream salesforce events directly to Amazon EventBridge. Analyse events originating from Salesforce instance, with targets such as Amazon Lambda...
 - Salesforce via Amazon AppFlow**: Amazon AppFlow enables streaming of Salesforce events directly to Amazon EventBridge. The connector will allow developers and teams to...
 - Auth0**: Auth0, the identity platform for application builders, provides developers and enterprises with the building blocks they need to secure...

CloudWatch container Insights

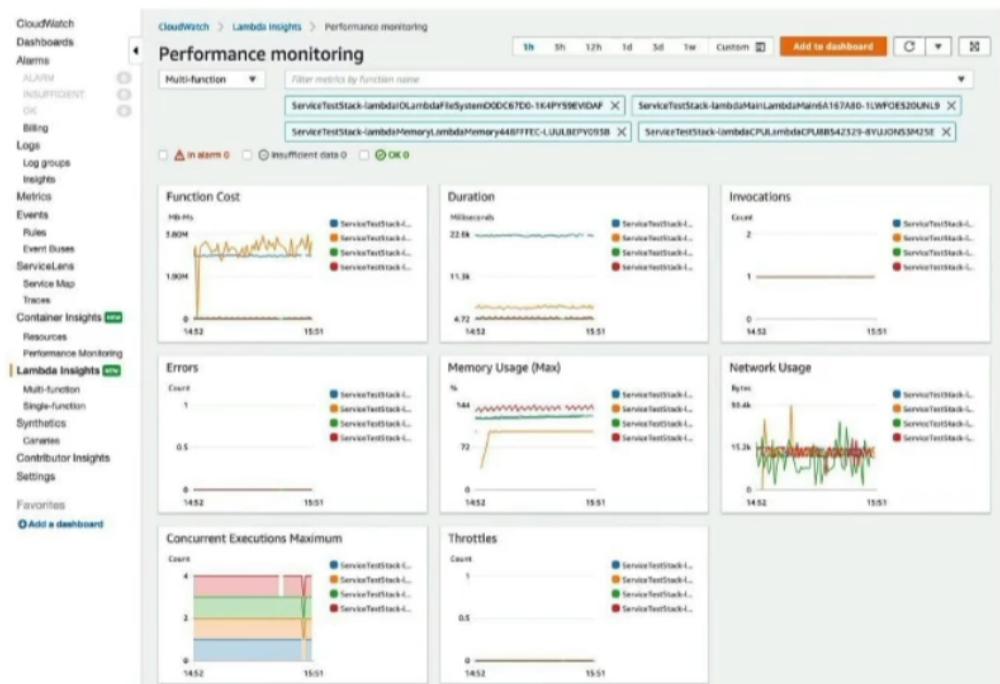

- Collect, aggregate, summarize **metrics and logs** from containers
- Available for containers on ...
 - Amazon Elastic Container Service (Amazon ECS)
 - Amazon Elastic Kubernetes Services (Amazon EKS)
 - Kubernetes platforms on EC2

- Fargate (both for ECS and EKS)
- In Amazon EKS and Kubernetes, CloudWatch Insights is using a containerized version of the CloudWatch Agent to discover containers

CloudWatch Lambda Insights

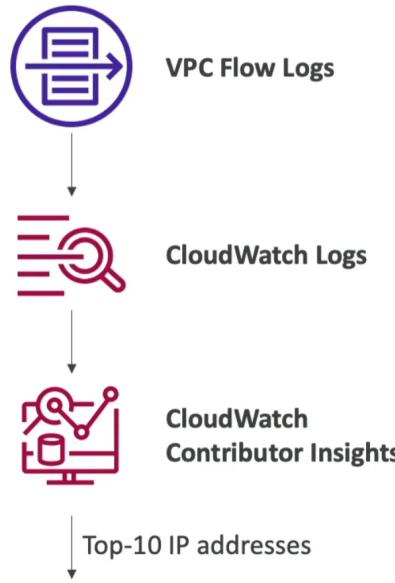

- Monitoring and troubleshooting solution for serverless applications running on AWS Lambda
- Collects, aggregates, and summarizes system-level metrics including CPU time, memory, disk, and network
- Collects, aggregates, and summarizes diagnostic information such as cold starts and Lambda worker shutdowns
- Lambda Insights is provided as a Lambda Layer

CloudWatch Contributor Insights

- Analyze log data and create time series that display contributor data
 - See metrics about the top-N contributors
 - The total number of unique contributors, and their usage.
- This helps you find top talkers and understand who or what is impacting system performance.
- Works for any AWS-generated logs (VPC, DNS, etc...)
- For example, you can find bad hosts, identify the heaviest network users, or find the URLs that generate the most errors
- You can build your rules from scratch, or you can also use sample rules that AWS has created - leverages your CloudWatch Logs

- CloudWatch also provides built-in rules that you can use to analyze metrics from other AWS services.

CloudWatch Application Insights

- Provides automated dashboards that show potential problems with monitored applications, to help isolate ongoing issues**
- Your applications run on Amazon EC2 Instances with select technologies only (Java, .NET, Microsoft IIS Web Server, databases...)
- And you can use other AWS resources such as Amazon EBS, RDS, ELB, ASG,Lambda,SQS, DynamoDB, S3 bucket, ECS, EKS, SNS, API Gateway...
- Powered by SageMaker
- Enhanced visibility into your application health to reduce the time it will take you to troubleshoot and repair your applications
- Findings and alerts are sent to Amazon EventBridge and SSM OpsCenter

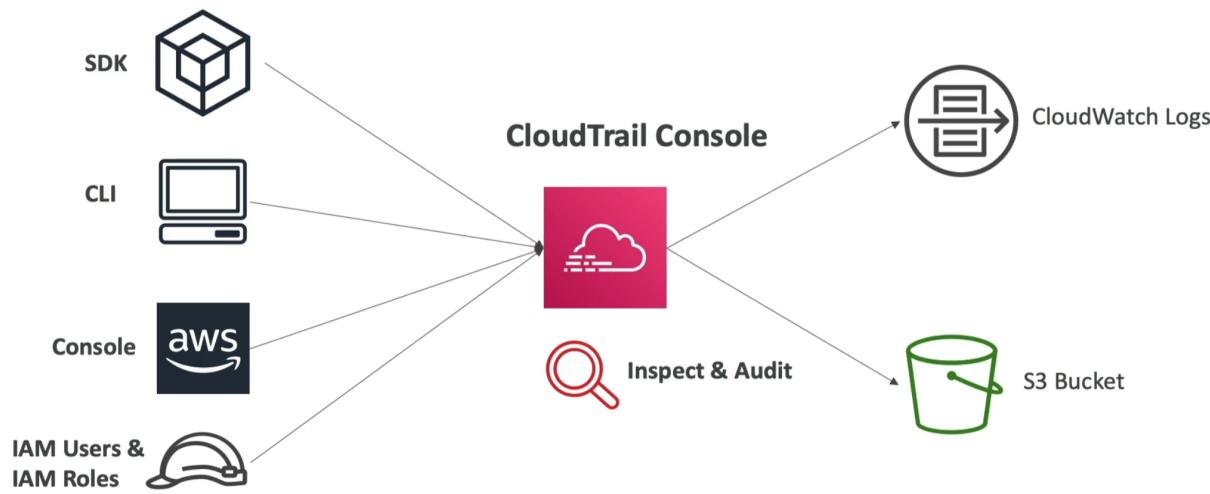

CloudWatch insights and Operational Visibility

- CloudWatch Container Insights**
 - ECS, EKS, Kubernetes on EC2, Fargate, needs agent for Kubernetes
 - Metrics and logs
- CloudWatch Lambda Insights**
 - Detailed metrics to troubleshoot serverless applications
- CloudWatch Contributors Insights**
 - Find "Top-N" Contributors through CloudWatch Logs
- CloudWatch Application Insights**
 - Automatic dashboard to troubleshoot your application and related AWS services

AWS CloudTrail

- Provides governance, compliance and audit for your AWS Account**
- CloudTrail is enabled by default !
- Get an history of events / API calls made within your AWS Account by:
 - Console
 - SDK
 - CLI
 - AWS Services
- Can put logs from CloudTrail into CloudWatch Logs or S3
- A trail can be applied to All Regions (default) or a single Region.**
- If a resource is deleted in AWS, investigate CloudTrail first !

CloudTrail Diagram

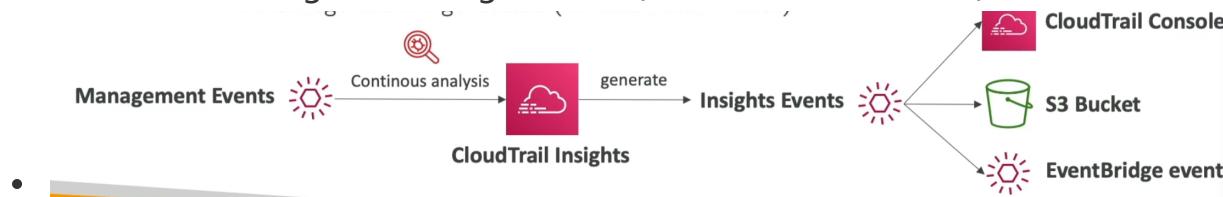

CloudTrail Events

- **Management Events:**
 - Operations that are performed on resources in your AWS account
 - Examples:
 - Configuring security (IAM **AttachRolePolicy**)
 - Configuring rules for routing data (Amazon EC2 **CreateSubnet**)
 - Setting up logging (AWS CloudTrail **CreateTrail**)
 - **By default, trails are configured to log management events.**
 - Can separate **Read Events** (that don't modify resources) from **Write Events** (that may modify resources)
- **Data Events:**
 - **By default, data events are not logged (because high volume operations)**
 - Amazon S3 object-level activity (ex: **GetObject**, **DeleteObject**, **PutObject**): can separate Read and Write Events
 - AWS Lambda function execution activity (the **Invoke API**)

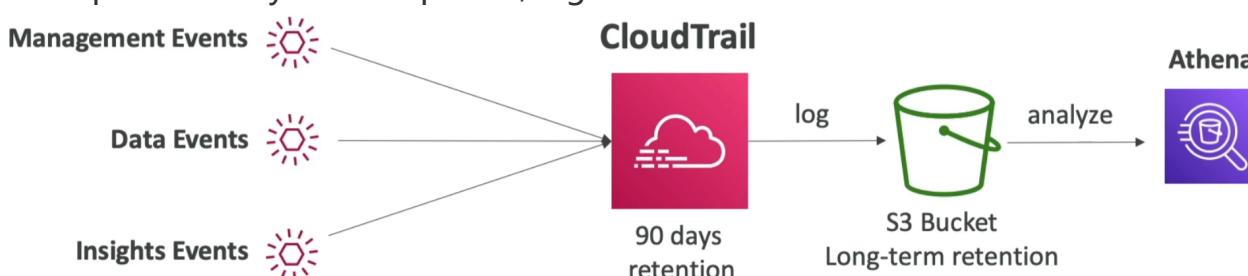

CloudTrail Insights

- Enable **CloudTrail Insights** to detect unusual activity in your account:
 - inaccurate resource provisioning
 - hitting service limits
 - Bursts of AWS IAM actions
 - Gaps in periodic maintenance activity
- CloudTrail Insights analyzes normal management events to create a baseline
- And then **continuously analyzes write events to detect unusual patterns**
 - Anomalies appear in the CloudTrail console
 - Event is sent to Amazon S3
 - An EventBridge event is generated(for automation needs)

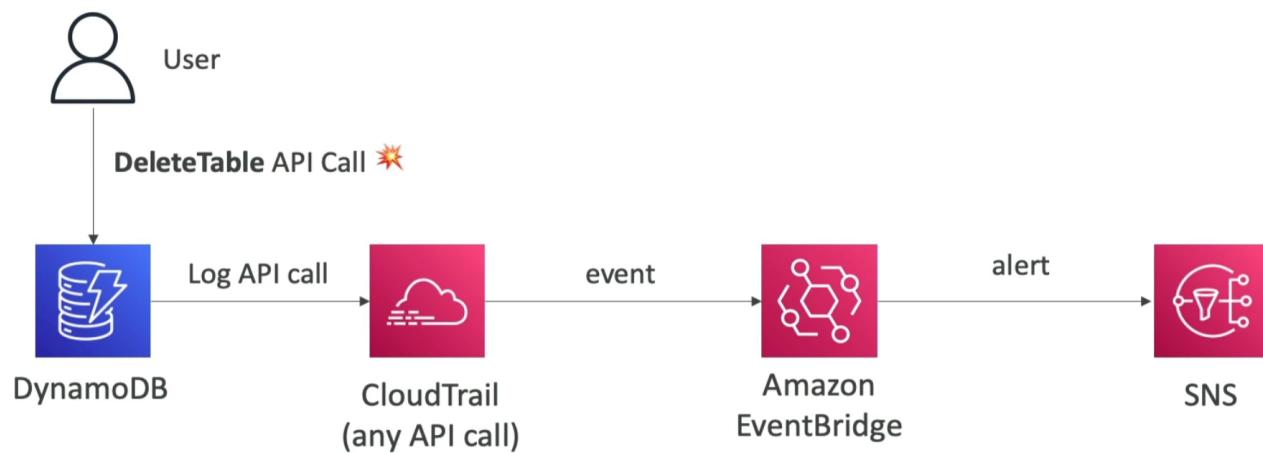

CloudTrail Events Retention

- Events are stored for 90 days in CloudTrail
- To keep events beyond this period, log them to S3 and use Athena

Amazon EventBridge - Intercept API Calls

Hands on

Screenshot 1: AWS CloudTrail Dashboard

The screenshot shows the AWS CloudTrail service page. On the left, there's a sidebar with links like Dashboard, Event history, Insights, Trails, Pricing, Documentation, Forums, and FAQs. The main area has a heading "AWS CloudTrail" with the subtext "Continuously log your AWS account activity". It includes a call-to-action button "Create a trail". Below this, there's a section titled "How it works" with a "Pricing" link.

Screenshot 2: AWS CloudTrail Dashboard - Trails

This screenshot shows the "Trails" section of the CloudTrail dashboard. It displays a table with columns for Name and Status, showing "No trails" and "No trails to display.". There's a "Create trail" button. To the right, a box states "CloudTrail Insights is not enabled" and provides a link to learn more.

Screenshot 3: AWS CloudTrail Event history

This screenshot shows the "Event history" section. It lists events such as "DeletePolicy" and "DeletePolicyVersion" from January 28, 2021. The interface includes filters for "Read-only", "Event name", "Event time", and "Event source", along with a "Create Athena table" button.

ap-southeast-1/	Folder	-	-	-
ap-southeast-2/	Folder	-	-	-

AWS Config

- Helps with auditing and recording **compliance** of your AWS resources
- Helps record configurations and changes over time
- Questions that can be solved by AWS Config:
 - Is there unrestricted SSH access to my security group?
 - Do my buckets have any public access?
 - How has my ALB configuration changed over time?
- You can receive alerts (SNS notifications) for any changes
- AWS Config is a per-region service
- Can be aggregated across regions and accounts
- Possibility of storing the configuration data into S3 (analyzed by Athena)

Config Rules

- Can use AWS managed config rules (over 75)
- Can make custom config rules (must be defined in AWS Lambda)

- Ex: evaluate if each EBS disk is of type gp2
- Ex: evaluate if each EC2 instance is t2.micro
- Rules can be evaluated / triggered:
 - For each config change
 - And / or: at regular time intervals
- **AWS Config Rules does not prevent actions from happening (no deny)**
- Pricing: no free tier, \$0.003 per configuration item recorded per region, \$ 0.001 per config rule evaluation per region

AWS Config Resource

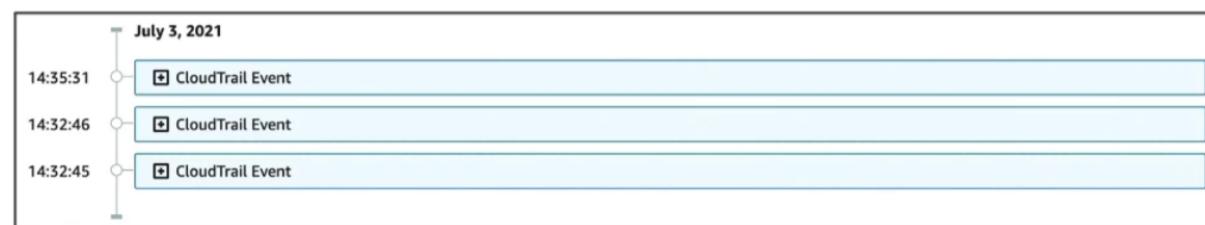

- View compliance of a resource over time

sg-077b425b1649da83e	EC2 SecurityGroup	Compliant
sg-0831434f1876c0c74	EC2 SecurityGroup	Noncompliant
sg-09f10ed254d464f30	EC2 SecurityGroup	Compliant

- View configuration of a resource over time

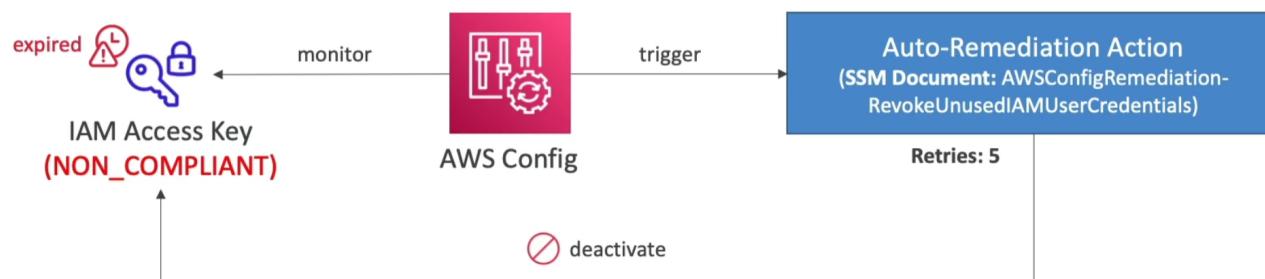

- View CloudTrail API calls of a resource over time

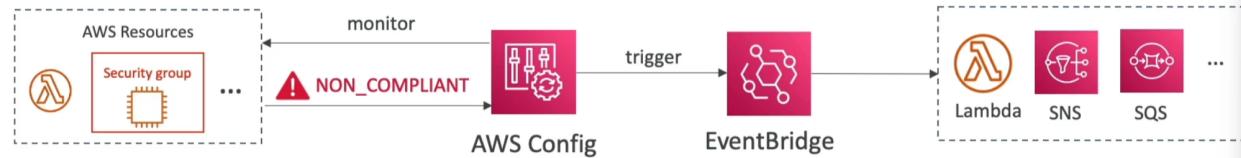

Config Rules - Remediations

- Automate remediation of non-compliant resources using SSM Automation Documents
- Use AWS-Managed Automation Documents or create custom Automation Documents
 - Tip: you can create custom Automation Documents that invokes Lambda function
- You can set **Remediation Retries** if the resource is still non-compliant after auto-remediation

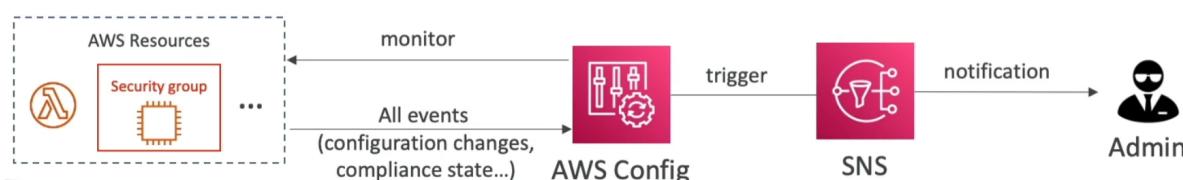

Config Rules - Notifications

- Use EventBridge to trigger notifications when AWS resources are non-compliant

- Ability to send configuration changes and compliance state notifications to SNS (all events - use SNS Filtering or filter at client-side)

Hands on

AWS Config > Set up AWS Config

Step 1
Settings

Step 2
Rules

Step 3
Review

Settings

General settings

Resource types to record

Record all resources supported in this region

To learn more, see [Supported Resource Types](#).

Record specific resource types

Include global resources (e.g., AWS IAM resources)
Supported global resource types are IAM users, groups, roles, and customer managed policies.

AWS Config role

Create AWS Config service-linked role

Choose a role from your account

Delivery method

Amazon S3 bucket

Create a bucket

Choose a bucket from your account

Choose a bucket from another account

Ensure appropriate permissions are available in this S3 bucket's policy. [Learn more](#).

S3 bucket name

Amazon SNS topic

Stream configuration changes and notifications to an Amazon SNS topic.
If you choose email as the notification endpoint for your SNS topic, this can cause a high volume of email. [Learn more](#).

AWS Config > Rules

Rules

Rules represent your desired configuration settings. AWS Config evaluates whether your resource configurations comply with relevant rules and summarizes the compliance results.

Rules				View details	Edit rule	Actions ▾	Add rule
				Any status			
Name	Remediation action	Type	Compliance				
No rules found.							
Add rule							

Step 1
Specify rule typeStep 2
Configure ruleStep 3
Review and create

Specify rule type

Add rules to define the desired configuration setting of your AWS resources. Customize any of the following rules to suit your needs, or create a custom rule. To create a custom rule, you must create an AWS Lambda function for the rule.

Select rule type

Add AWS managed rule
Customize any of the following rules to suit your needs.

Create custom rule
Create custom rules and add them to AWS Config. Associate each custom rule with an AWS Lambda function, which contains the logic that evaluates whether your AWS resources comply with the rule.

AWS Managed Rules (4)

 ami

< 1 >

Name	Labels	Description
<input checked="" type="radio"/> approved-amis-by-id	EC2	Checks whether running instances are using specified AMIs.
<input type="radio"/> approved-amis-by-tag	EC2	Checks whether running instances are using specified AMIs.
<input type="radio"/> iam-inline-policy-blocked-kms-actions	IAM, Zelkova	Checks that the inline policies attached to your IAM users, roles, and groups do not allow blocked actions on all AWS Key Management Service (KMS) keys. The rule is NON_COMPLIANT if any blocked action is allowed on all KMS keys in an inline policy.
<input type="radio"/> secretsmanager-secret-periodic-rotation	SecretsManager, Secret, Periodic, Rotation	Checks if AWS Secrets Manager secrets have been rotated in the past 90 days by examining 'LastRotatedDate' value of the secret. If 'LastRotatedDate' doesn't exist then this rule will check for the creation date of the secret.

CloudWatch vs CloudTrail vs Config

- CloudWatch
 - Performance monitoring (metrics, CPU, network, etc...) & dashboards
 - Event & Alerting
 - Log Aggregation & Analysis
- CloudTrail
 - Record API calls made within your Account by Everyone
 - Can define trails for specific resources
 - Global Service
- Config
 - Record configuration changes
 - Evaluate resources against compliance rules
 - Get timeline of changes and compliance

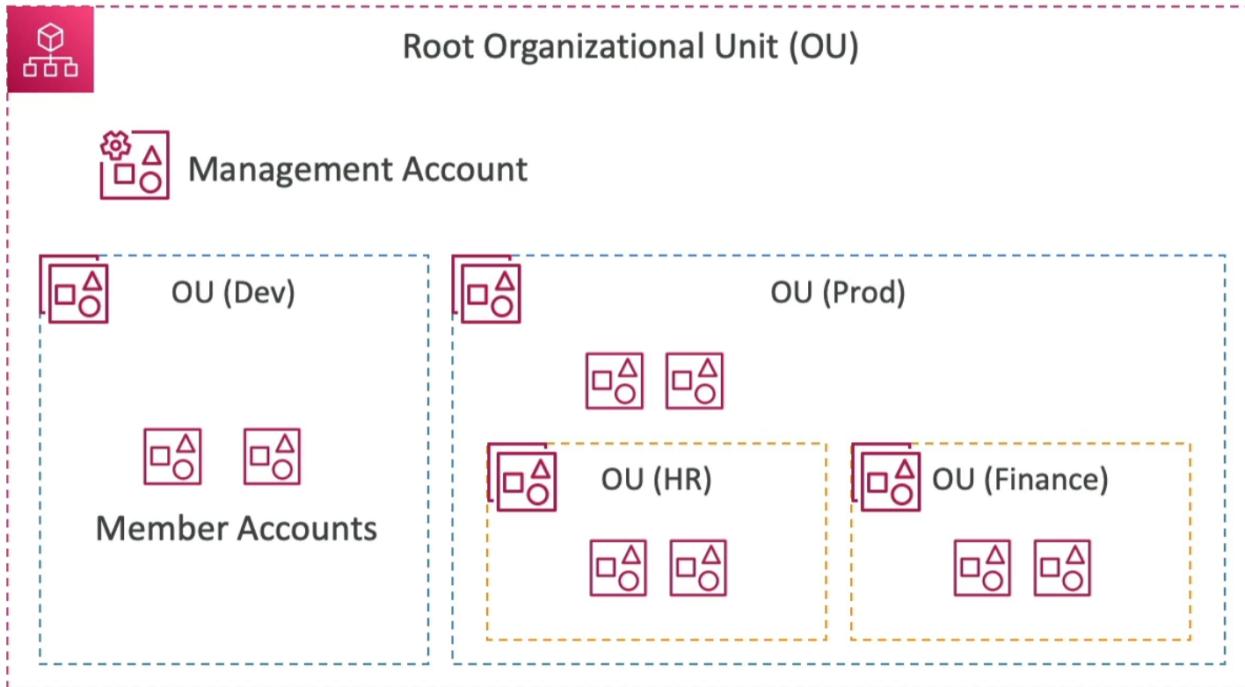

For an Elastic Load Balancer

- CloudWatch:
 - Monitoring Incoming connections metric
 - Visualize error codes as a % over time
 - Make a dashboard to get an idea of your load balancer performance
- Config:
 - Track security group rules for the Load Balancer
 - Track configuration changes for the Load Balancer
 - Ensure an SSL certificate is always assigned to the Load Balancer (compliance)
- CloudTrail:
 - Track who made any changes to the Load Balancer with API calls

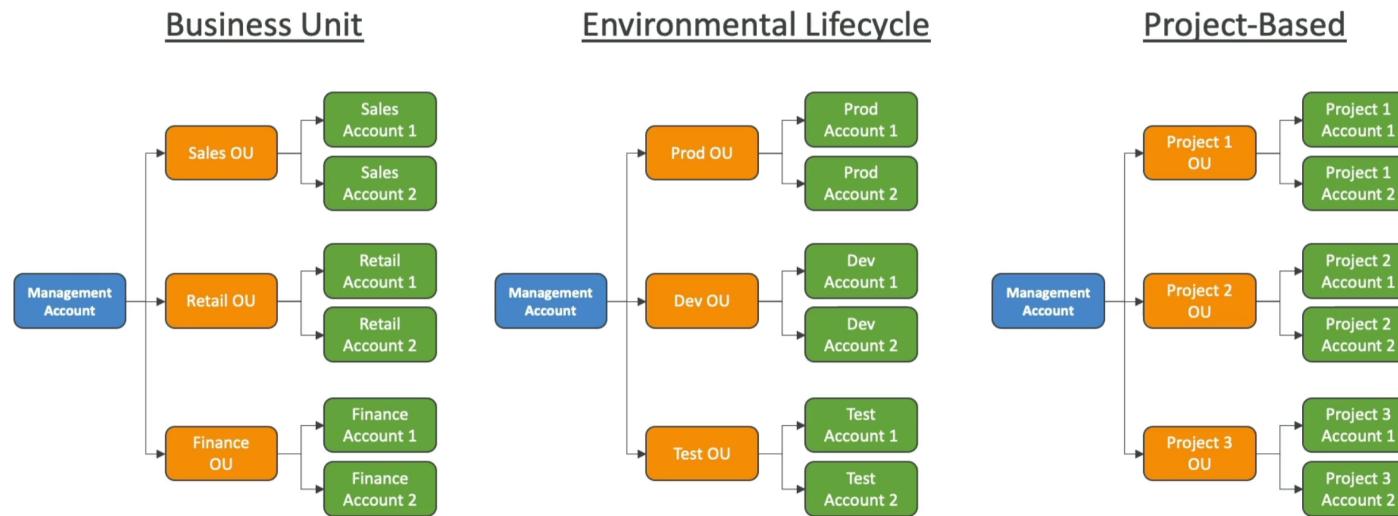

AWS Organizations

- Global service
- Allows to manage multiple AWS accounts
- The main account is the management account
- Other accounts are member accounts
- Member accounts can only be part of one organization
- Consolidated Billing across all accounts - single payment method
- Pricing benefits from aggregated usage (volume discount for EC2, S3...)
- **Shared reserved instances and Savings Plans discounts across accounts**

- API is available to automate AWS account creation

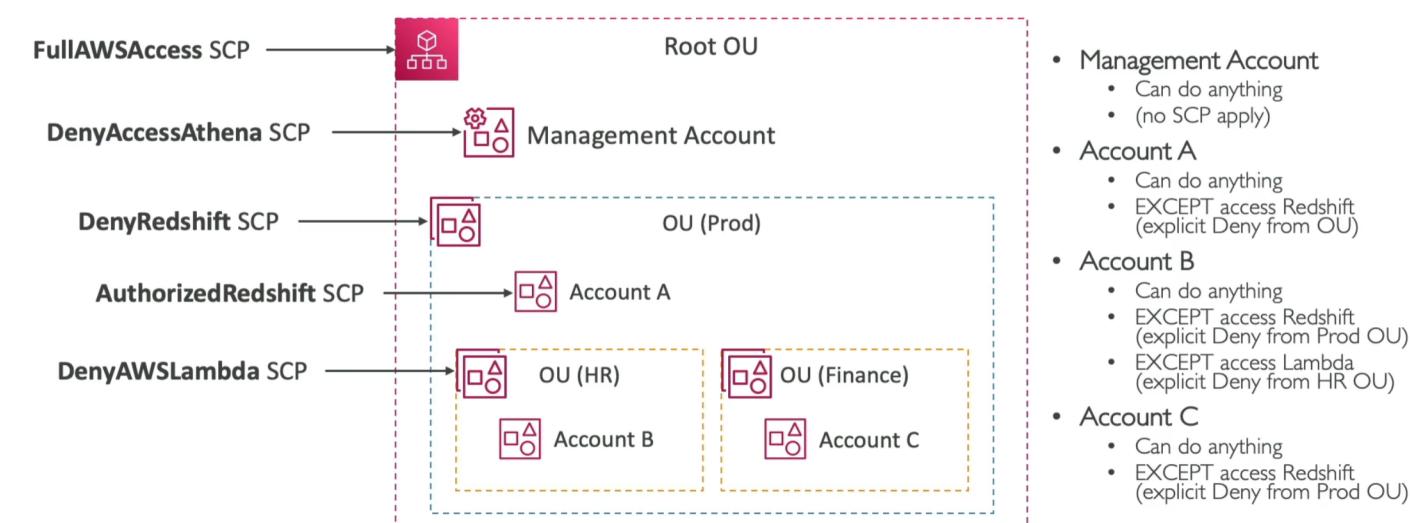

Organizational Units (OU) - Examples

AWS Organizations

- **Advantages**
 - Multi Account vs One Account Multi VPC
 - Use tagging standards for billing purposes
 - Enable CloudTrail on all accounts, send logs to central S3 account
 - Send CloudWatch Logs to central logging account
 - Establish Cross Account Roles for Admin purposes
- **Security: Service Control Policies (SCP)**
 - IAM policies **applied to OU or Accounts** to restrict Users and Roles
 - They do not apply to the management account (fully admin power)
 - Must have an explicit allow (does not allow anything by default - like IAM)

SCP Hierarchy

SCP Examples

Blocklist and Allowlist strategies

The image shows two side-by-side screenshots of AWS IAM policy JSON code. The left screenshot shows a policy allowing all actions on all resources and then explicitly denying access to the DynamoDB service. The right screenshot shows a policy that denies access to the EC2 and CloudWatch services and then allows access to all other resources.

Hnads on

The image shows the AWS Organizations console interface. It features a navigation bar at the top with links for Services, Search for services, features, marketplace products, and docs, and account details like aws-course-master, Global, and Support. Below the navigation is a banner for the new AWS Organizations console experience. The main content area is titled 'AWS Organizations' and describes it as 'Central management for multiple AWS accounts'. It includes a call-to-action button 'Create an organization' and information about consolidated billing features. A sidebar on the left lists 'Invitations' and 'Management & Governance'. A modal window at the bottom left indicates a successful creation of an AWS organization.

The image shows the AWS accounts page within the AWS Organizations console. At the top, there is a success message: 'You successfully created an AWS organization.' The page title is 'AWS accounts'. On the right, there is a prominent orange button 'Add an AWS account'. The main content area displays the organizational structure. It shows a single root account named 'aws-course-master' which is a 'management account'. The account was created on '2021/05/17'. There is also a search bar at the top for finding AWS accounts by name, email, or account ID.

IAM Conditions

aws:SourceIp
restrict the client IP from
which the API calls are being made

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": "*",
      "Resource": "*",
      "Condition": {
        "NotIpAddress": {
          "aws:SourceIp": ["192.0.2.0/24", "203.0.113.0/24"]
        }
      }
    }
  ]
}
```

aws:RequestedRegion
restrict the region the
API calls are made to

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": ["ec2:*", "rds:*", "dynamodb:*"],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "aws:RequestedRegion": ["eu-central-1", "eu-west-1"]
        }
      }
    }
  ]
}
```

ec2:ResourceTag
restrict based on tags

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["ec2:startInstances", "ec2:StopInstances"],
      "Resource": "arn:aws:ec2:us-east-1:123456789012:instance/*",
      "Condition": {
        "StringEquals": {
          "ec2:ResourceTag/Project": "DataAnalytics",
          "aws:PrincipalTag/Department": "Data"
        }
      }
    }
  ]
}
```

aws:MultiFactorAuthPresent
to force MFA

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:*",
      "Resource": "*",
      "Condition": {
        "BoolIfExists": {
          "aws:MultiFactorAuthPresent": false
        }
      }
    }
  ]
}
```

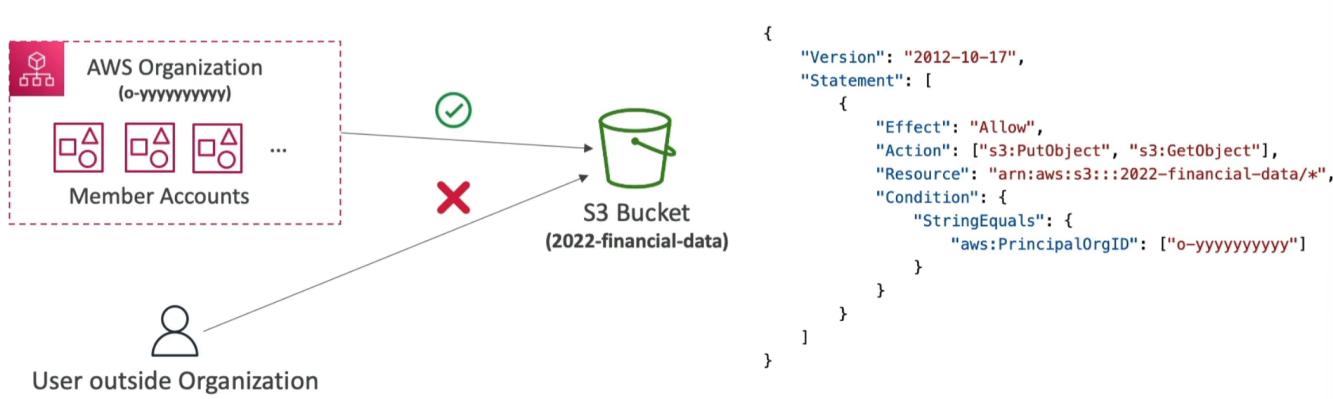

IAM for S3

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": ["s3>ListBucket"],  
            "Resource": "arn:aws:s3:::test"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "s3>PutObject",  
                "s3>GetObject",  
                "s3>DeleteObject"  
            ],  
            "Resource": "arn:aws:s3:::test/*"  
        }  
    ]  
}
```

- s3>ListBucket permission applies to arn:aws:s3:::test
- => bucket level permission
- s3>GetObject,s3>PutObject,
- s3>DeleteObject applies to arn:aws:s3:::test/*
- => object level permission

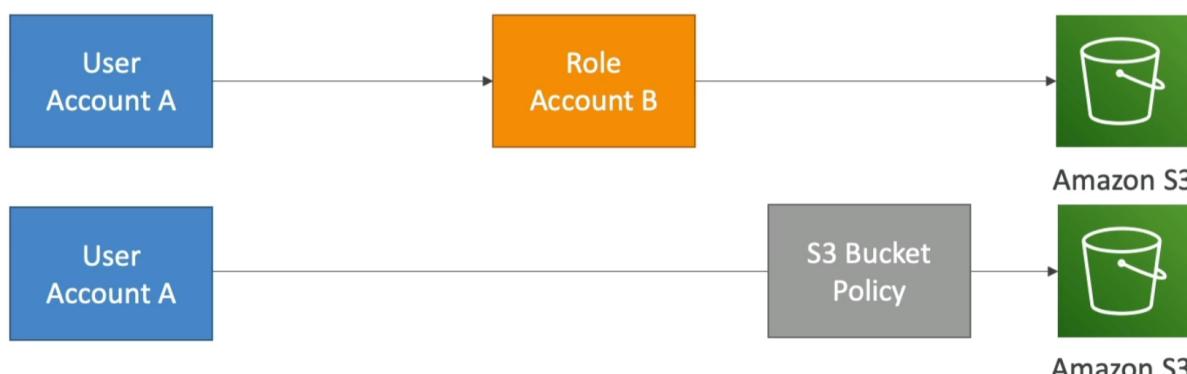

Resource Policies & aws:PrincipalOrgID

- **aws:PrincipalOrgID** can be used in any resource policies to restrict access to accounts that are member of an AWS Organization

IAM Roles vs Resource Based Policies

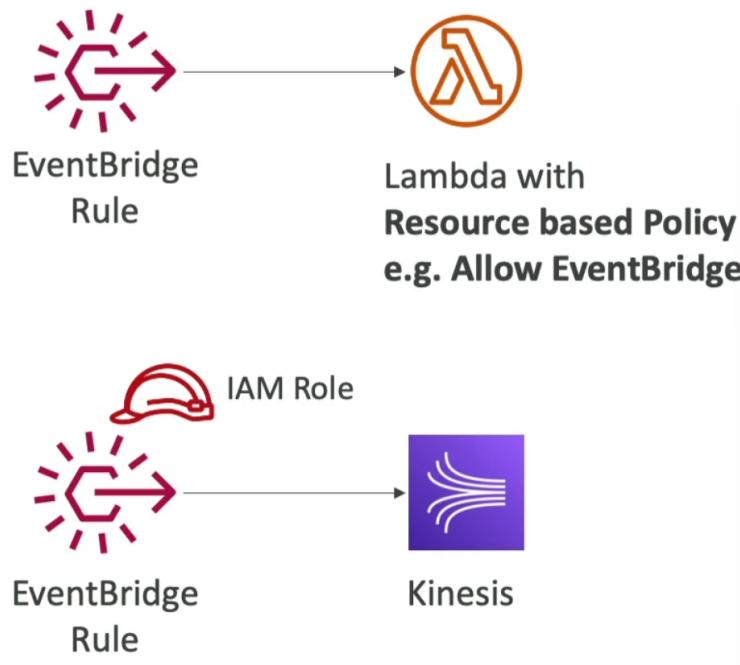

- Cross account:
 - attaching a resource-based policy to a resource (example: S3 bucket policy)
 - OR using a role as a proxy

- When you assume a role (user,application or service), you give up your original permissions and take the permissions assigned to the role
- When using a resource-based policy, the principal doesn't have to give up his permissions
- Example: User in account A needs to scan a DynamoDB table in Account A and dump it in an S3 bucket in Account B
- Supported by: Amazon S3 buckets, SNS topics, SQS queues, etc...

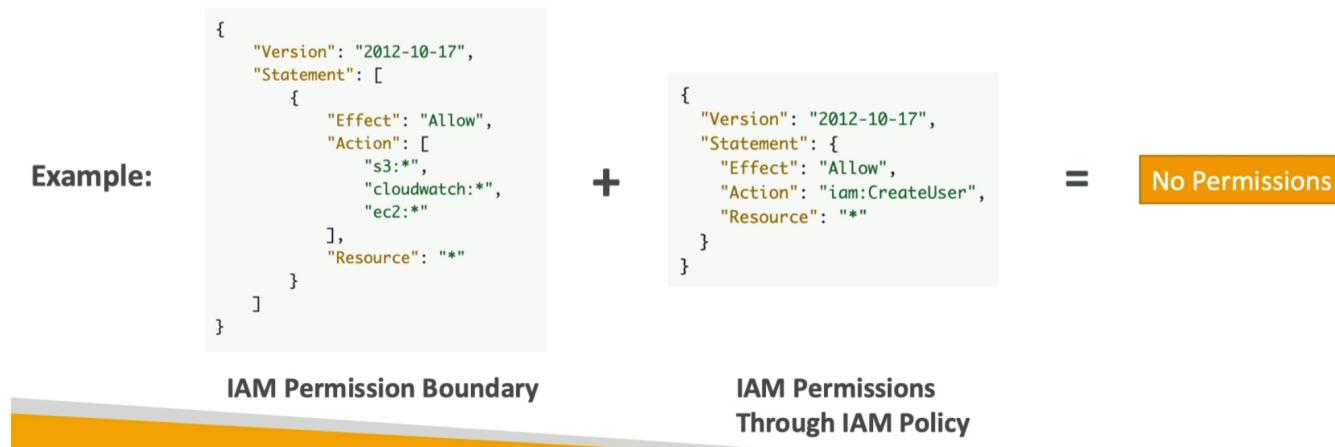

Amazon EventBridge - Security

- When a rule runs, it needs permissions on the target
- Resource-based policy: Lambda, SNS, SQS, CloudWatch Logs, API Gateway...
- IAM role: Kinesis stream, Systems Manager Run Command, ECS task ...

IAM Permission Boundaries

- IAM Permission Boundaries are supported for users and roles (not groups)
- Advanced feature to use a managed policy to set the maximum permissions an IAM entity can get

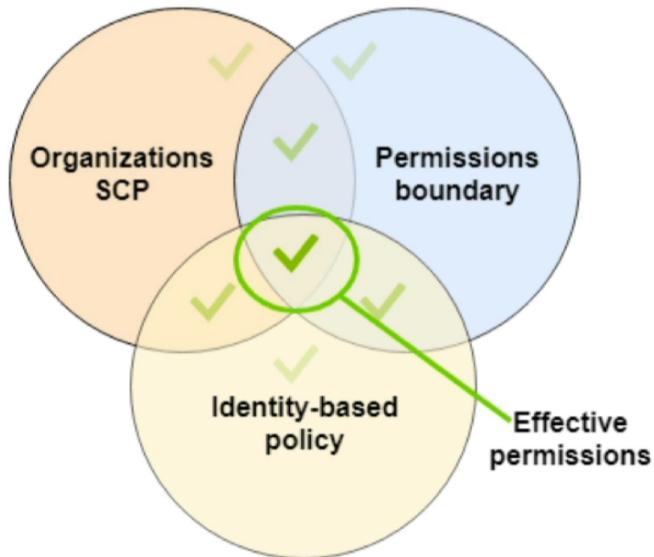

The screenshot shows the AWS IAM Summary page for a user named 'john'. The left sidebar shows the navigation menu for Identity and Access Management (IAM). The main summary page displays the following information:

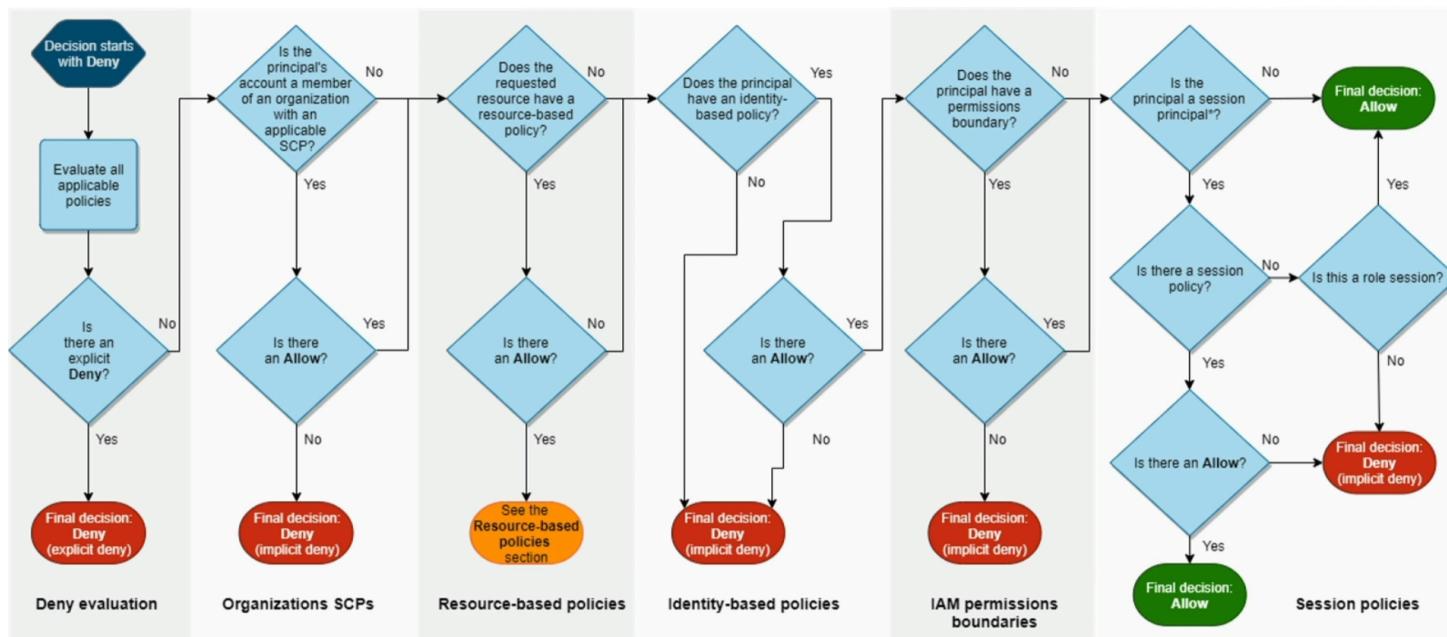

- Permissions boundary:** AmazonS3FullAccess has been set for john.
- User ARN:** arn:aws:iam::387124123361:user/john
- Path:** /
- Creation time:** 2020-03-30 18:14 UTC+0100
- Permissions tab:** Shows one policy applied: AdministratorAccess (AWS managed policy).
- Attached directly:** Shows the policy is attached directly.
- Permissions boundary (set):** Shows the boundary is set to control the maximum permissions this user can have.

- Can be used in combinations of AWS Organizations SCP
- Use cases
 - Delegate responsibilities to non administrators within their permission boundaries, for example create new IAM users
 - Allow developers to self-assign policies and manage their own permissions, while making sure they can't "escalate" their privileges (= make themselves admin)

- Useful to restrict one specific user(instead of a whole account using Organizations & SCP)

IAM Policy Evaluation Logic

Example IAM Policy

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": "sns:CreateTopic",
      "Effect": "Deny",
      "Resource": "*"
    },
    {
      "Action": [
        "sns:DeleteTopic"
      ],
      "Effect": "Allow",
      "Resource": "*"
    }
  ]
}
  
```

- Can you perform sns: CreateTopic? No
- Can you perform sns: DeleteTopic? No
- Can you perform ec2: DescribeInstances? Yes

Amazon Cognito

- Give users an identity to interact with our web or mobile application
- **Cognito User Pools:**
 - Sign in functionality for app users
 - Integrate with API Gateway & Application Load Balancer
- **Cognito Identity Pools (Federated Identity):**

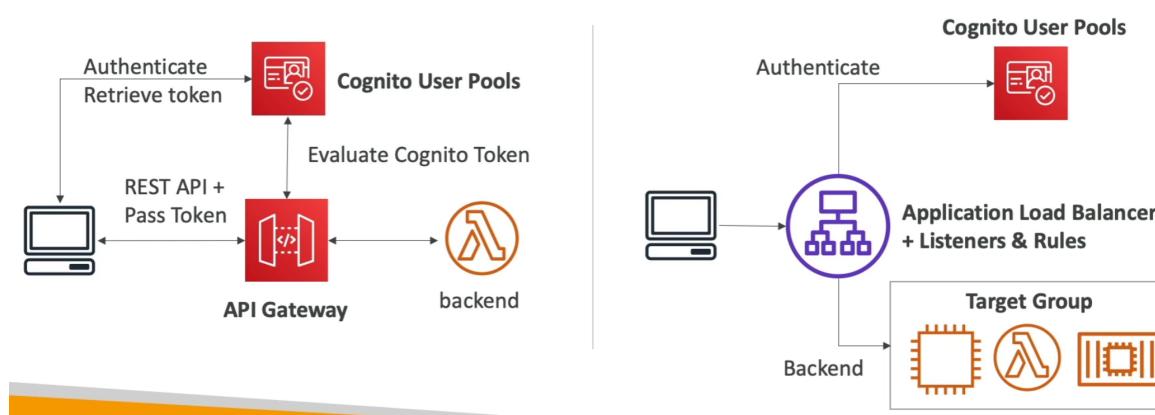

- Provide AWS credentials to users so they can access AWS resources directly
- Integrate with Cognito User Pools as an identity provider
- **Cognito vs IAM:** "hundreds of users", "mobile users", "authenticate with SAML"

Cognito User Pools (CUP) - User Features

- Create a serverless database of user for your web & mobile apps
- Simple login: Username (or email) / password combination
- Password reset
- Email & Phone Number Verification
- Multi-factor authentication(MFA)
- Federated Identities: users from Facebook, Google, SAML ...

Cognito User Pools (CUP) - Integrations

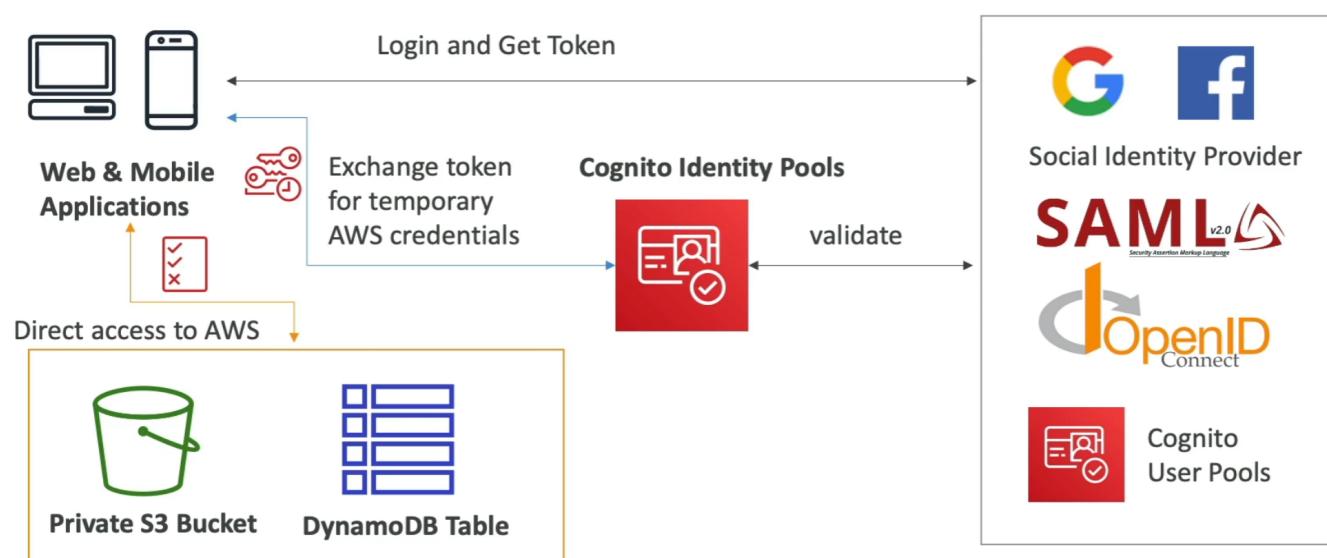

- CUP integrates with **API Gateway** and **Application Load Balancer**

Cognito Identity Pools (Federated Identities)

- Get identities for "users" so they obtain temporary AWS credentials
- Users source can be Cognito User Pools, 3rd party logins, etc...
- Users can then access AWS services directly or through API Gateway
- The IAM policies applied to the credentials are defined in Cognito
- They can be customized based on the user_id for fine grained control
- Default IAM roles for authenticated and guest users

Cognito Identity Pools - Diagram

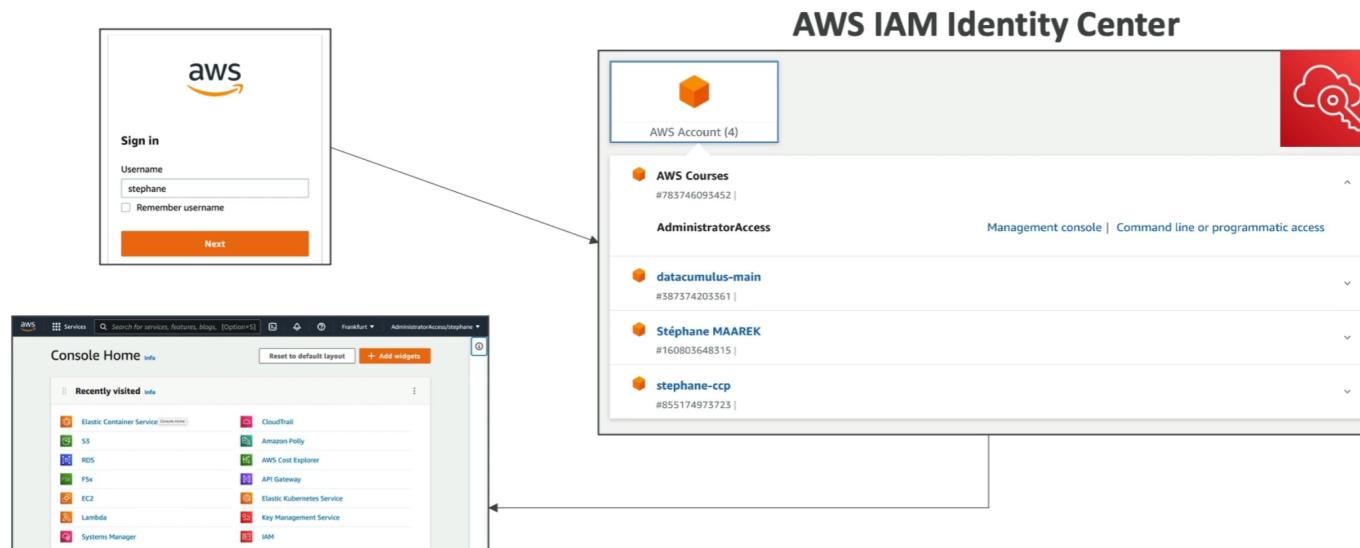

Cognito Identity Pools Row Level Security in DynamoDB

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [

```

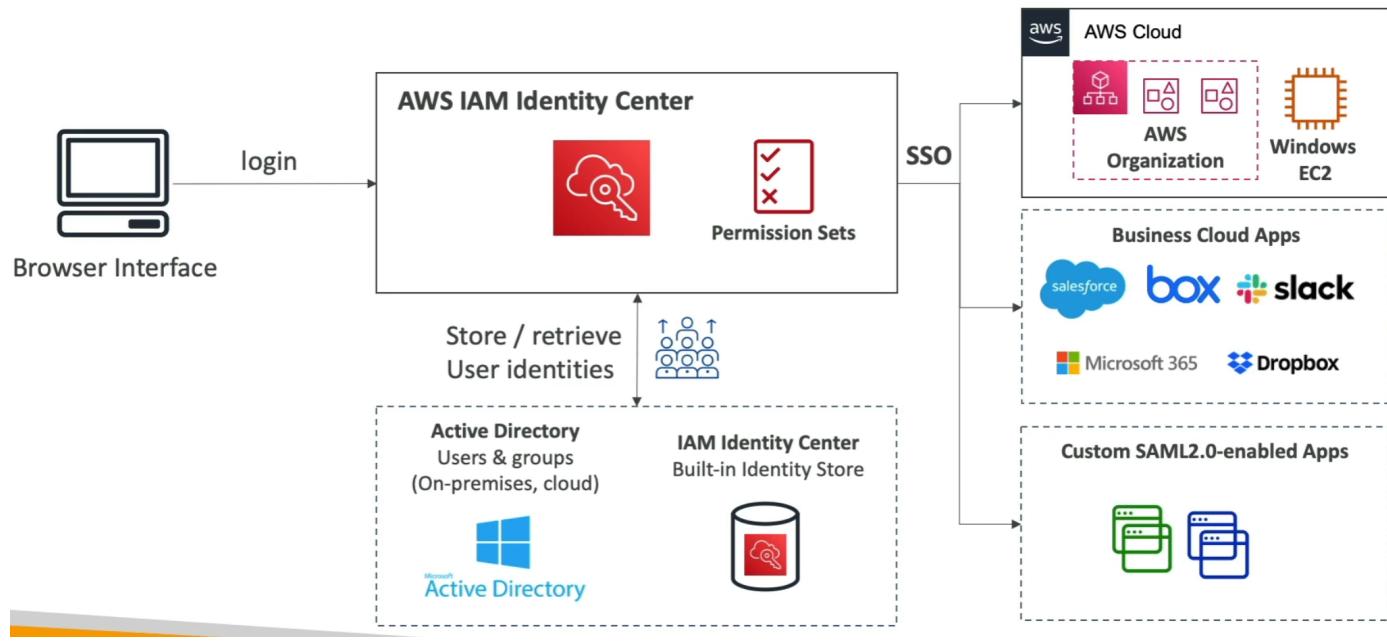

AWS IAM Identity Center (successor to AWS Single Sign-On)

- One login (single sign-on) for all your
 - **AWS accounts in AWS Organizations**
 - Business cloud applications (e.g., Salesforce, Box, Microsoft 365, ...)
 - SAML2.0-enables applications
 - EC2 Windows Instances
 - Identity providers
 - Built-in identity store in IAM Identity Center
 - 3rd party: Active Directory (AD), OneLogin, Okta ...

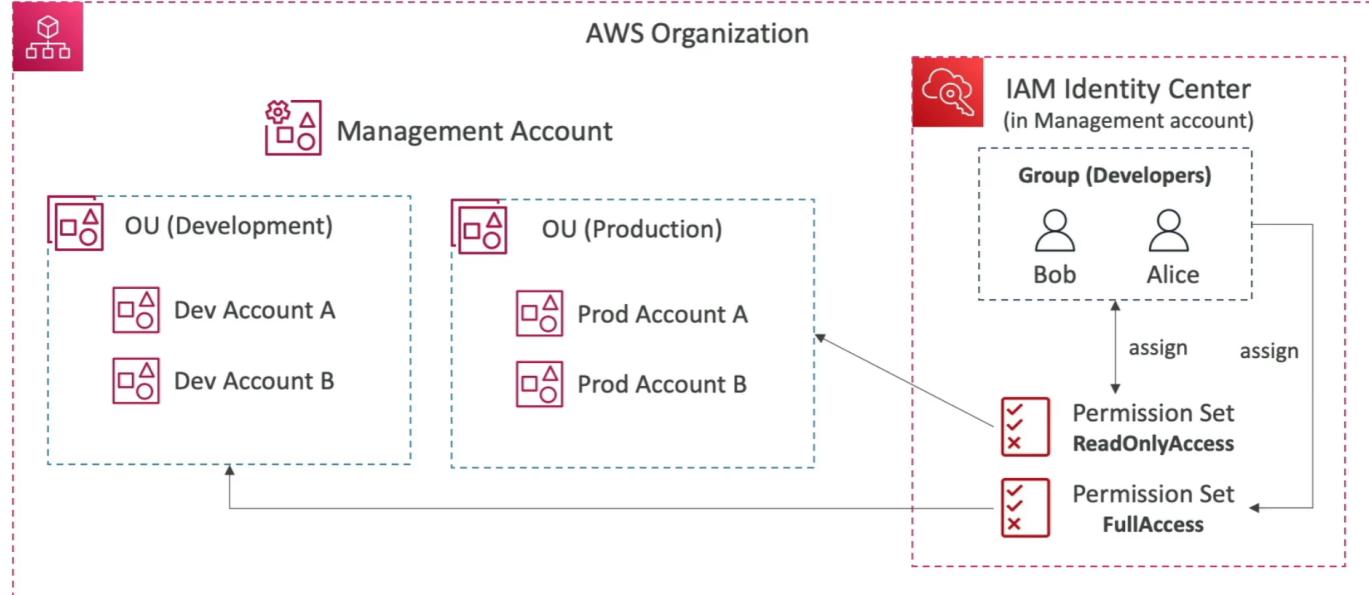

AWS IAM Identity Center - Login Flow

AWS IAM Identity Center

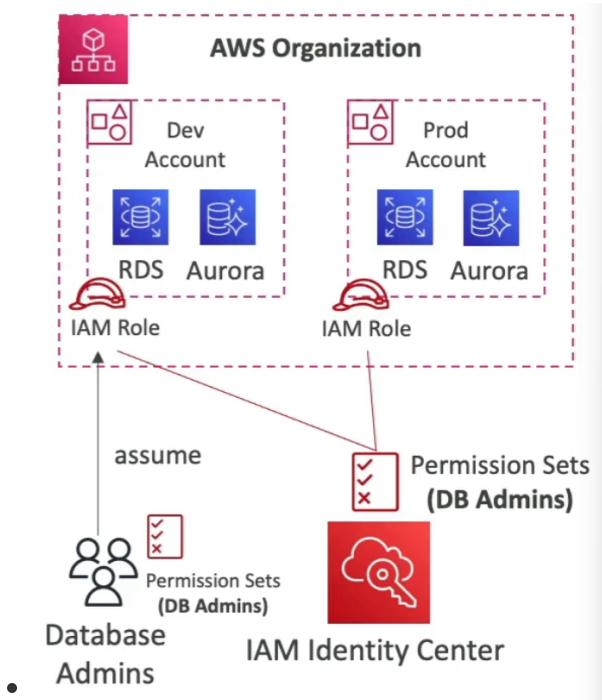

IAM Identity Center

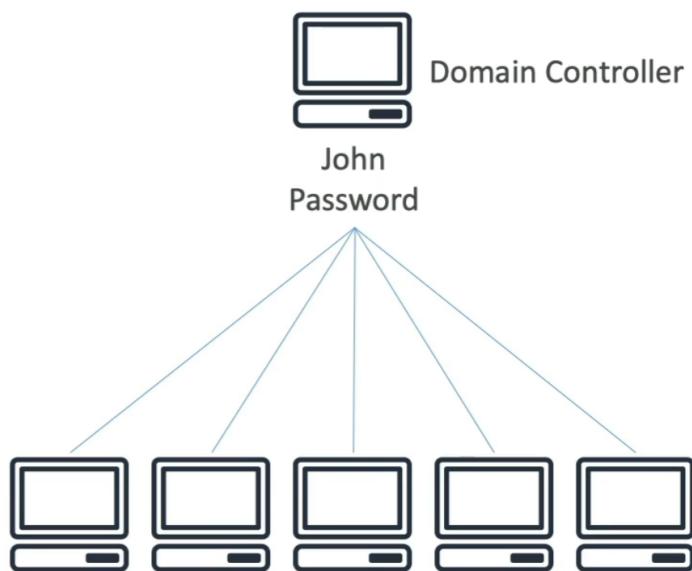

AWS IAM Identity Center Fine-grained Permissions and Assignments

- **Multi-Account Permissions**
 - Manage access across AWS accounts in your AWS Organization
 - Permission Sets - a collection of one or more IAM Policies assigned to users and groups to define AWS access
- **Application Assignments**
 - SSO access to many SAML 2.0 business applications (Salesforce, Box, Microsoft 365, ...)
 - Provide required URLs, certificates, and metadata
- **Attribute-Based Access Control (ABAC)**
 - Fine-grained permissions based on users' attributes stored in IAM Identity Center Identity Store
 - Example: cost center, title, locale, ...
 - Use case: Define permissions once, then modify AWS access by changing the attributes

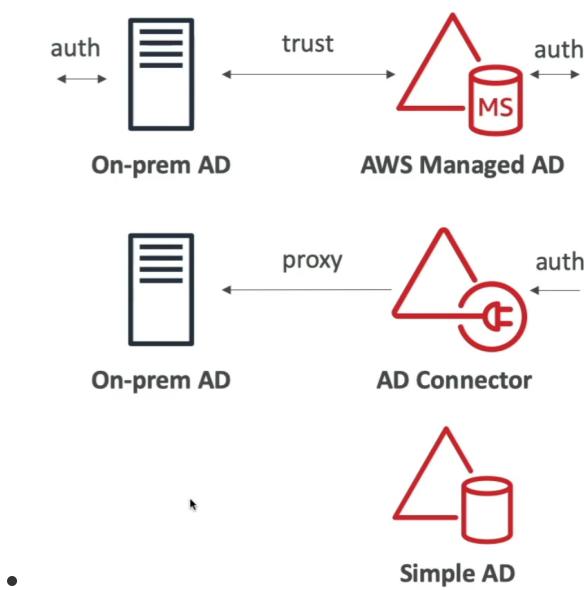

What is Microsoft Active Directory (AD)

- Found on any Windows Server with AD Domain Services
- Database of objects: User Accounts, Computers, Printers, File Shares, Security Groups
- Centralized security management, create account, assign permissions
- Objects are organized in **trees**
- A group of trees is a **forest**

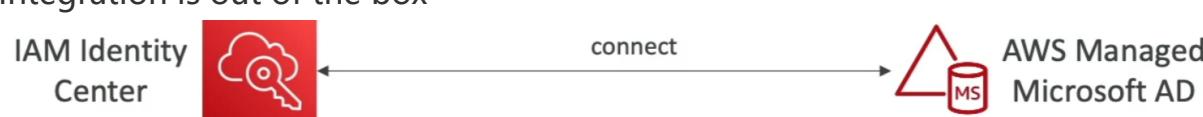

AWS Directory Services

- **AWS Managed Microsoft AD**
 - Create your own AD in AWS, manage users locally, supports MFA
 - Establish "trust" connections with your on-premise AD
- **AD Connector**
 - Directory Gateway(proxy) to redirect to on-premise AD, supports MFA
 - Users are managed on the on-premise AD
- **Simple AD**
 - AD-compatible managed directory on AWS
 - Cannot be joined with on-premise AD

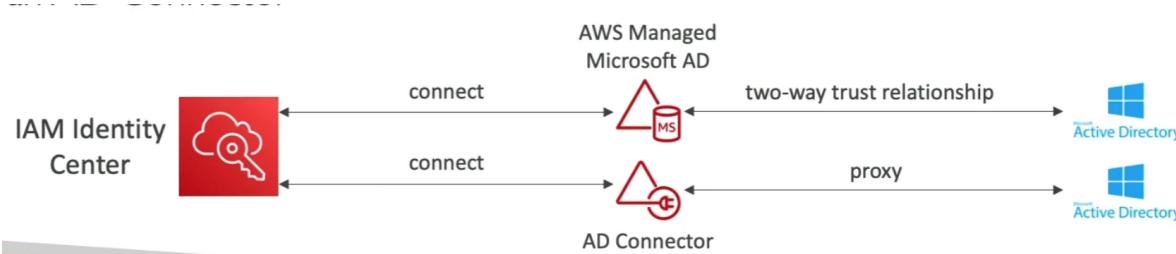

IAM Identity Center - Active Directory Setup

- **Connect to an AWS Managed Microsoft AD (Directory Service)**
 - Integration is out of the box

- **Connect to a Self-Managed Directory**

- Create Two-way Trust Relationship using AWS Managed Microsoft AD
- Create an AD Connector

AWS Control Tower

- Easy way to **set up and govern a secure and compliant multi-account AWS environment** based on best practices
- AWS Control Tower uses AWS Organizations to create accounts
- Benefits:
 - Automate the set up of your environment in a few clicks
 - Automate ongoing policy management using guardrails
 - Detect policy violations and remediate them
 - Monitor compliance through an interactive dashboard

AWS Control Tower - Guardrails

- Provides ongoing governance for your Control Tower environment (AWS Accounts)
- **Preventive Guardrail - using SCPs** (e.g., Restrict Regions across all your accounts)
- **Detective Guardrail - using AWS Config** (e.g., identify untagged resources)
